

The Accrete Level Threshold Two Stage* Channel and grate system is consistent in accordance to New Zealand Building code E2/AS1, the requirements of drainage around level threshold systems is always 200mm wide by 150mm depth from the foundation edge.

To reduce the project lead times, Accrete Design manufacture the channel first, it is then installed, and the required cladding completed. After which the grate is measured and manufactured to suit cladding and joinery.

When ordering grates, to make this an easier process for the installer we ask for tight measurements from the outside of the edge to the cladding.
